

1. Development Environment & Coding Tools

I regularly use Visual Studio Code as my primary IDE for writing and debugging code. I use Git and GitHub for version control and collaboration, especially for managing projects like my React To-Do app.

2. Web Frameworks

I use React.js to build interactive web applications. I have used it to create projects like a To-Do List with features such as adding, deleting, and marking tasks as complete.

3. AI/ML Frameworks

I have basic experience with TensorFlow and scikit-learn for experimenting with simple machine learning models and understanding core ML concepts.

4. Agentic AI Tools

I have explored agent-based workflows using tools like AutoGPT and LangChain, mainly for understanding automation and task chaining.

5. LLM Platforms

I frequently use OpenAI (ChatGPT) for coding assistance, debugging, and learning new concepts. It helps me accelerate development and problem-solving.

6. AI Tools Frequently Used

I use GitHub Copilot for code suggestions and productivity, and ChatGPT for explanations, debugging, and generating ideas for projects.

7. Cloud Platforms

I have basic experience with Firebase for hosting and backend services, especially for small web applications.

8. Databases

I use MongoDB for NoSQL database projects and MySQL for relational database tasks, including normalization and query writing during my DBMS coursework.
